Parking Stress Survey for Twinkle Star Children's Home

Description To support a change of use planning application, our client needed to prove parking availability within a 200 metre walking distance of their Class C3 site. We were commissioned to conduct a parking survey to gather data on parking capacity and usage from 7am to 6pm, which covered the operational hours of the proposed children's home. The survey aimed to capture the current parking demand, identify peak usage times and assess overall availability on-street.

Approach Our team carried out a detailed survey over two consecutive days covering the below points;

- Measuring all parking restrictions and converting to parking capacity
- Occupancy beat counts every hour to record parked vehicles & their location
- Photographs to illustrate the parking stress levels
- Local public transport within the area

Outcome After performing the parking survey, our reporting team were able to understand the parking demand per road and pressure points within the survey area. The survey found that the average parking stress remained below 70%, with only certain time periods and locations being more heavily stressed. Based on this finding, the report concluded that the local council may consider that there is sufficient capacity in the survey area to accommodate additional parking generated by this development.
